Increased flexibility for new LANmark-5 range

Nexans has enhanced its LANmark-5 range with the addition of fixed PCB patch panels in order to be more competitive where the benefits of the sliding versions are not required. Historically similar products were only available in the e-ssential range but many installers requested this type of product for inclusion within the full LANmark Warranty.

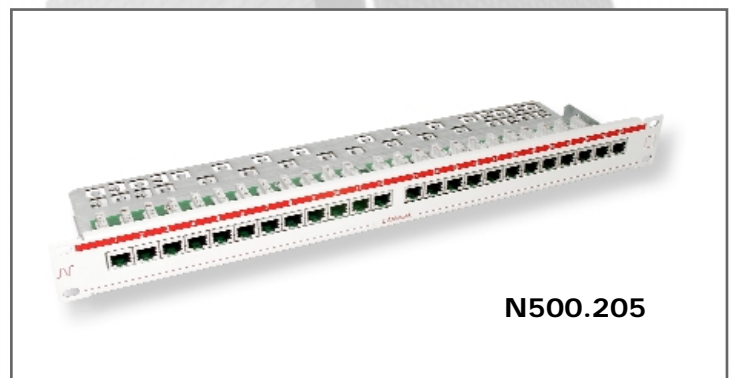

Two new products have been introduced - an unscreened (N500.205) and a screened (N500.215) version, both featuring **fixed top connection LSA/110 punchdown terminations** and a **standard tie-wrap cable management plate**. The screened version utilises 9 pin IDC blocks for easy termination of the drain wire.

N500.215

Both products exceed the Category 5e performance requirements with significant headroom and can be used within a **LANmark Certified System Warranty**.

In order to avoid duplication with the similar essential range products, these new references will replace the equivalent e-ssential top connection panels. The products will be phased in as stocks are replenished within the channel.

N500.205

The addition of these new items means that LANmark provides even better value for money **with full Parts & Labour warrantied systems** available using a wider choice of products.
